

NgRx Signal Store - One Page Cheat Sheet

Install

npm install @ngrx/signals

Create Store

signalStore(withState({count:0}), withMethods(...))

Core APIs

withState() - define state

withMethods() - actions/business logic

withComputed() - derived values

withHooks() - init/destroy hooks

patchState() - update state

Update State

patchState(store, { count: store.count() + 1 });

Computed

doubleCount: computed(() => store.count() * 2)

Inject Store

store = inject(CounterStore);

Use in Template

{{ store.count() }}

{{ store.doubleCount() }}

RxJS Integration

rxMethod() for API calls and async flows.

Typical Flow

Component -> Store Method -> patchState -> UI Updates

Interview Notes

- Signals instead of Observables for state access
- Less boilerplate than classic NgRx Store
- Great for feature/local state
- Still supports RxJS when needed
