

NgRx Signal Store - Full Working Example

Goal: Create a working Counter Store and API example.

1. Install

```
npm install @ngrx/signals
```

2. counter.store.ts

```
import { signalStore, withState, withMethods, withComputed, patchState } from '@ngrx/signals';  
import { computed } from '@angular/core';
```

```
withState({count:0})  
withComputed((store)=>({ doubleCount: computed(()=>store.count()*2) })))  
withMethods((store)=>({  
  increment(){ patchState(store,{count:store.count()+1}) },  
  decrement(){ patchState(store,{count:store.count()-1}) },  
  reset(){ patchState(store,{count:0}) }  
})))
```

3. Component

```
store = inject(CounterStore);  
increment(){ this.store.increment(); }
```

4. Template

```
Count: {{ store.count() }}  
Double: {{ store.doubleCount() }}
```

API Example with rxMethod

loadUsers: rxMethod(pipe(...))
Call: this.store.loadUsers();

rxMethod is used for API calls, debouncing, searching, and RxJS flows.

Interview Notes

withState -> state
withMethods -> actions
withComputed -> derived values
withHooks -> lifecycle
patchState -> update state
rxMethod -> async operations

Flow:

Component -> Store Method -> patchState -> UI Update
